```

This document explains how to interact with the various Docker containers that power the Local Food AI system.

Starting the Stack

To start the application and all its microservices:

```
# Standard environment
docker-compose up -d

# Windows / WSL environment (if applicable)
docker-compose -f docker-compose-wsl.yml up -d
```

Connecting to Specific Containers

1. MySQL Database

To access the MySQL shell directly:

```
docker exec -it food-mysql-1 mysql -u root -p
```

Note: The password is defined in your `.env` file (`MYSQL_ROOT_PASSWORD`).

2. Ollama (AI Engine)

To manage LLM models or test the AI engine:

```
docker exec -it food-ollama-1 bash
# Inside the container, you can run:
# ollama list
# ollama run qwen2.5:1.5b
```

3. SearXNG (Web Search)

To view the SearXNG logs if the web search context is failing:

```
docker logs -f food-searxng-1
```

4. Zabbix (Telemetry)

If you need to access the Zabbix server or agent:

```
docker exec -it food-zabbix-server-1 bash
```

Health Checks

You can verify that all application components are working using:

```
docker ps
```

Look for **Up (healthy)** in the STATUS column for the `mysql` service, and ensure `food-app-1` (Streamlit) is running without restarting.
